SUMMARY

Final-year Computer Science undergraduate (Cybersecurity specialization) who designs and ships full-stack systems. Built a distributed IoT platform using MQTT publish/subscribe messaging and a multi-threaded REST API, alongside production React and Next.js applications. Comfortable from message brokers and API design through to accessible, performant front ends. Seeking a remote software engineering internship.

EDUCATION

SRM University – AP Expected May 2027
B.Tech, Computer Science and Engineering — Specialization in Cybersecurity CGPA: 7.4/10

EXPERIENCE

Salesforce Developer Intern May 2025 – Jul 2025
SmartBridge — Agentblazer Champion Program, in collaboration with Salesforce Remote

- Completed an 8-week structured development program covering organizational setup, data modeling, security management, and process automation.
- Built and tested custom **Apex** classes and **Lightning Web Components**, applying object-oriented and event-driven patterns; earned the **Object Relationships Superbadge** and certified as an **Agentblazer Champion**.

PROJECTS

Smart Home Automation — Distributed IoT System
github.com/panvee/Home-Automation-Using-Voice-Command · Python, MQTT (paho-mqtt), REST APIs, Multi-threading, JavaScript, Mosquitto

- Architected a **distributed IoT platform across three decoupled processes** over **MQTT publish/subscribe**, using wildcard topic subscriptions so new devices require no bridge changes.
- Built a **multi-threaded REST API** exposing device control, registration, and natural-language command endpoints, running a concurrent HTTP server alongside the MQTT event loop with CORS support.
- Implemented a **voice command interpreter routing 13 intent patterns** to dedicated handlers, supporting compound commands and time-based scheduling, plus **real-time energy monitoring** across 9 device types with event-driven state synchronisation.
- Identified and documented **security gaps in own design during post-build review** — unauthenticated REST endpoints behind an authenticated UI, and unencrypted MQTT transport — with a prioritized remediation plan.

SoftSell — Software License Marketplace (Credex Internship Assignment)
github.com/panvee/SoftSell-Software-License-Marketplace · React, Vite, Tailwind CSS, Framer Motion, React Helmet

- Delivered a **complete React + Vite single-page application** for a technical internship assignment, architected across **8 modular components** covering hero, process flow, trust indicators, testimonials, and lead capture.
- Implemented **system-aware dark mode** with manual override, a client-side validated lead capture form, and an interactive chat widget structured for a live LLM backend.

Valorix — VALORANT Performance Platform
github.com/panvee/valorix · Next.js 15, React 19, TypeScript, Tailwind CSS v4, Framer Motion, Supabase, Vercel

- Architected a **production-grade Next.js 15 / React 19 application** from scratch, including a custom design system built on Tailwind CSS v4 design tokens and a layered component architecture.
- Implemented scroll-linked motion with **prefers-reduced-motion accessibility guards** on every animated component, hand-built SVG charts with **zero charting dependencies**, and shipped via a **GitHub → Vercel CI/CD pipeline** under strict TypeScript.

Crowd Detection System — Computer Vision Pipeline
github.com/panvee/crowd-detect-ai · Python, YOLOv8, OpenCV, NumPy

- Built a **real-time computer vision pipeline** detecting people in video using **YOLOv8**, clustering detection centroids by Euclidean distance to identify crowd formations, with **temporal persistence tracking** separating sustained events from transient groupings and structured CSV event logging.

TECHNICAL SKILLS

Languages: Python, JavaScript, TypeScript, Apex, SQL, HTML, CSS
Backend & Systems: REST API design, MQTT / publish-subscribe messaging, multi-threaded services, event-driven architecture, Supabase, PostgreSQL (basics)
Frontend: React, Next.js, Vite, Tailwind CSS, Framer Motion, responsive and accessible UI development
AI & Computer Vision: YOLOv8, OpenCV, NumPy
DevOps & Tools: Docker, Git, GitHub, Vercel, CI/CD pipelines, Linux, Mosquitto
Practices: Distributed system design, technical specification writing, security review, CI/CD, code review

CERTIFICATIONS & ACHIEVEMENTS

SAP Certified — SAP Generative AI Developer, SAP (2026) • **GenAI for Front-End Developers**, Coursera (2025) • **Intro to Front-End Development**, Meta (2025) • **Google AI Essentials**, Google (2025)
Participant, **Data Analytics** and **Data Science with Python** Hackathons — TechGyan, with Elan & Nvision, **IIT Hyderabad** (2025)
